

Group 3:
Buenaobra, Noel Joseph
Cadigoy, Dean Gabriel
Pancho, Nicholas
Salvador, Louis Abraham
Vergara, Jizel

Part 1:

Three Security Threats:

1. Weak IAM policies, allowing multiple employees full administrative access.
 - Can allow exposure of sensitive data from insider risk.
 - One account breached results in the entire thing being breached.
2. No multi-factor authentication (MFA) for user logins.
 - Can easily exploit weak passwords.
 - No barriers to access sensitive information.
3. Lack of logging & monitoring, so security incidents were not detected early.
 - Delayed breach detection.
 - Identifying the breach(such as the what, when, how) becomes more difficult.

Part 2:

Group 3: Ransomware Attack on Cloud Storage (An attacker encrypts a company’s cloud data due to weak storage access controls and lack of backups.)

No.	Security Risk	Solution
1.	Weak Storage Access Controls	• Add a least-privilege access policies (IAM) • Implement a role-based access control (RBAC)
2.	Lack of Backups	• Do automated, regular backups • Store backups separately
3.	Lack of Monitoring and Early Threat Detection	• Add threat detection tools • Enable Logging
