Introduction

CloudPDF is a web application that works as an AI-powered thesis repository made to streamline academic research. It allows institutions to:

- **Store** thesis in a centralized repository.
- **Checker** thesis to deduce if the uploaded pdf file is actually a thesis..
- **Analyze** academic papers to create a title and summary for uploaded thesis

It aims to reduce the reliance on paper documentation, improve academic accessibility, and accelerate research by making past academic works available for the students of the institution.

Project Objective:

- To store the thesis in a centralized Repository.
- To create an AI-Powered document title and summary generator.
- To create an AI-powered pdf checker in order to only allow actual thesis pdf.

Methodology

TECHNOLOGY APPLIED

Technology	Purpose
Laravel	Serves as the backend of the website.
React	Serves as the frontend of the website.
Gemini AI	AI used for the website: Model/Gemini-2.5-flash-lite

Result:

UI:

Basic General User Interface

Upload:

Allows upload of pdf, checks if pdf is thesis or not.

AI Generated Title and Summary:

Title and Summary of uploaded thesis

Analysis and Discussion

The system is a laravel backend + react frontend website where the user has its logic and functionalities behind laravel while react calls laravel routes to call certain functionality, more specifically, controllers.

The system worked well with its functionality, it did its job to store and analyze pdf files seamlessly. It was able to incorporate Gemini AI into its system and use it as its AI model to generate titles and summaries of uploaded pdf as well as check if the pdf is a thesis or not. It also has a sign in and sign up feature where users are allowed to have their own account within the website.

Conclusion

While the website worked well for its purpose, it is very much limited. It does not have many features other than its basic and main features. It could have a lot of improvements in the UI aspect as well as the UI is very minimalistic with barely any features. Overall, it is a great website with potential but at its current state, it is severely limited and could use a lot of improvements.

Recommendation:

- Improvements in the UI
- Improve the optimization
- Install more features(Pictures Readers, Ai powered search feature, etc.)
- Better AI model
