guidelines

1. many image training for the AI model to learn different appearances of an object, which includes different angles,lighting,backgrounds and distances for the AI to recognize better.

2.if the training data is poor the AI will not learn correctly it will make wrong predictions,confuse objects and have low confidence score

3.it will misclassify objects if the training is not diverse enough. similar looking objects, poor lighting or background that can resemble the trained image will confuse the model.

4.Security System for Face Detection or Object Detection

HealthCare for detecting diseases from medical images

Mobile Apps for gesture control and object scanning
